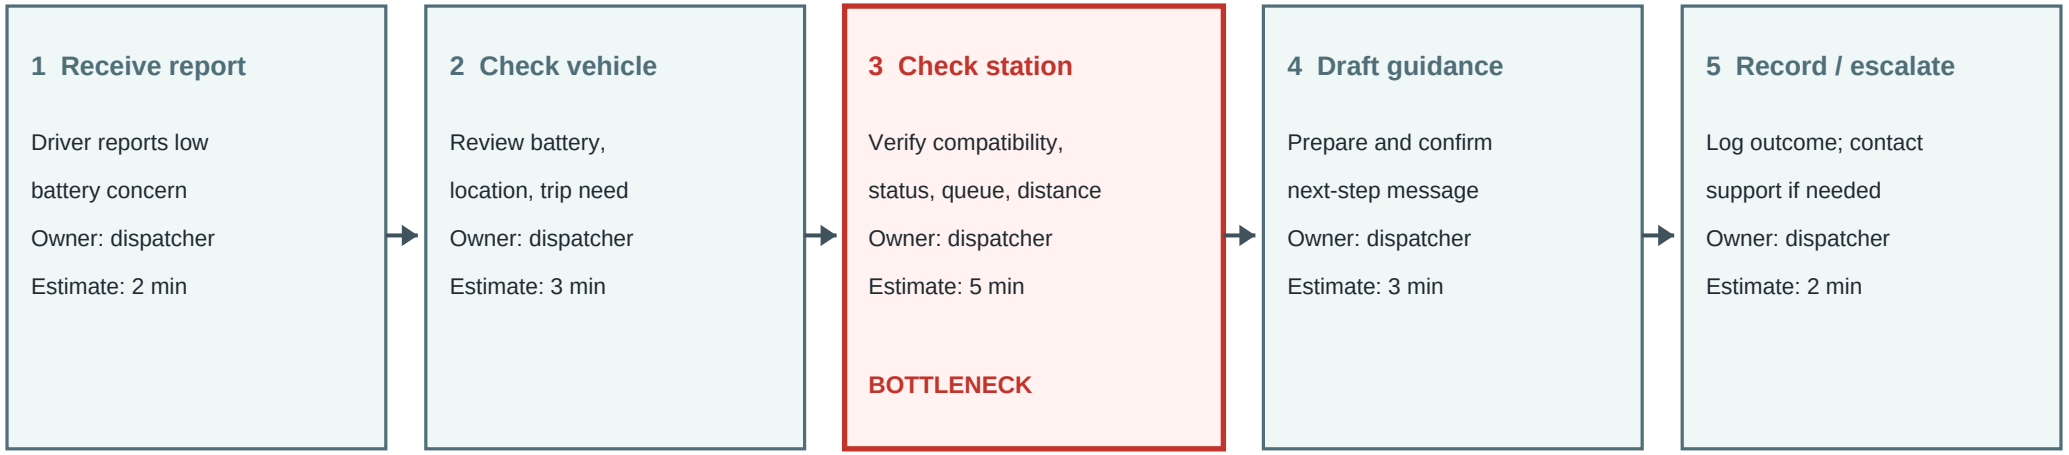
Xanh SM Charging Co-pilot | Current-State Workflow

Discovery hypothesis only: timing and tool sequence must be validated with dispatchers.

HANDOFFS: driver -> dispatcher | dispatcher across vehicle/station tools
Dispatcher -> driver



Estimated active handling time: 15 minutes per case (assumption; instrument a real baseline).

Potential failure points: stale station status, incompatible connector, incomplete driver location, or trip urgency omitted.

Current-state fallback: dispatcher verifies information manually and escalates to charging support when needed.
